3-2 Videos Guide

3-2a

- Definition of a limit of a function f of two variables
 - $\lim_{(x,y)\to(a,b)} f(x,y) = L \text{ if for every } \varepsilon > 0 \text{ there is a } \delta > 0 \text{ such that if } (x,y) \text{ is in the domain of } f \text{ and } 0 < \sqrt{(x-a)^2 + (y-b)^2} < \delta \text{ then } |f(x,y)-L| < \varepsilon$

Exercises:

3-2b

• Find the limit, if it exists, or show that the limit does not exist

$$\begin{array}{ll}
\circ & \lim_{(x,y)\to(2,-1)} \frac{x^2y + xy^2}{x^2 - y^2} \\
\circ & \lim_{(x,y)\to(0,0)} \frac{5y^4 \cos^2 x}{x^4 + y^4}
\end{array}$$

3-2c

$$\circ \lim_{(x,y)\to(0,0)} \frac{xy^4}{x^4+y^4}$$

- Reminder of the Squeeze Theorem in \mathbb{R}^2 (which also holds in higher dimensions)
 - o If $f(x) \le g(x) \le h(x)$ on an open interval containing a (except possibly at a) and if $\lim_{x \to a} f(x) = \lim_{x \to a} h(x) = L$, then $\lim_{x \to a} g(x) = L$

Exercise:

• Determine the set of points at which the function is continuous.

$$G(x,y) = \ln(1+x-y)$$

• Use polar coordinates to find the limit.

$$\lim_{(x,y)\to(0,0)} (x^2 + y^2) \ln(x^2 + y^2)$$
